Department of Artificial Intelligence and Machine Learning

TEACHER ASSESSMENT

SEM-V [2026-27]

S.Y. B. Tech.

Vision:

Fostering technical excellence in Artificial Intelligence and Machine Learning through ethics, innovative research, and sustainable education.

Mission:

M1. Innovative and interactive learning processes with high-quality instructional programs in Artificial Intelligence and Machine Learning.

M2. Fostering a collaborative scientific temper among students with ethical responsibility towards society in AI and ML applications.

M3. Preparing students from diverse backgrounds to develop aptitude for employment, entrepreneur ship, and research in AI and ML with a spirit of professionalism.

SEMESTER-III_A.Y._2026-2027

Class : **TY B. Tech.**

Course Name : **Machine Learning**

Course Code : **RCP23APC301**

Faculty Name : **Dr. Pankaj V. Baviskar**

S.N.	Course Category	Course Code	Course Title	L	T	P	TA (A)	Term Test 1 (TT1)	Term Test 2 (TT2)	Average (TT1 & TT2) (B)	ESE (C)	Total (A+B+C)	Credit

4	SKAT	10
5	TT	15
Total		40

Teacher Assessment Activity (TA-I)

Activity Details: TA-I Marks is based on following criteria:

1. CodeChef (**Machine Learning**) course completion certificate **(03 Marks)**
2. Marks on passing CodeChef Test 1 **(01 Marks)**
3. Marks on passing CodeChef Test 2 **(01 Marks)**

Total Marks: 05

Roll No	Name of Candidate	PRN	CodeChef Module
1	MALI AADITYA DILIP	221107044	**Test- I (Module I & II)** **Test-II (Module III, IV & V)**

Course Teacher

Teacher Assessment Activity-II
Mock Interview Questions

Sr. No.	Question	Answer
1	What is Machine Learning?	Machine Learning is a branch of AI that enables computers to learn patterns from data and make predictions or decisions without being explicitly programmed for every task.
2	What is the difference between supervised and unsupervised learning?	Supervised learning uses labelled data to learn a mapping between input and output, while unsupervised learning works with unlabelled data to discover patterns or groups.
3	What is the Bias-Variance Trade-off?	Bias is error due to an overly simple model, while variance is error due to a model being too sensitive to training data. A good model balances bias and variance to generalize well.
4	What is the difference between MAE and MSE?	MAE is the average absolute error, while MSE is the average squared error. MSE penalizes large errors more strongly than MAE.
5	What is Cross-Validation?	Cross-validation divides the dataset into multiple parts and repeatedly uses different parts for training and validation to estimate model performance more reliably.
6	What is ROC curve?	ROC (Receiver Operating Characteristic) curve shows the relationship between True Positive Rate and False Positive Rate at different classification thresholds.
7	What is Linear Regression?	Linear Regression is a supervised learning algorithm that models the relationship between dependent and independent variables using a linear equation such as y=wx+by=wx+b.
8	What is Gradient Descent?	Gradient Descent is an optimization algorithm that iteratively updates model parameters in the direction that reduces the cost function.
9	What is Regularization?	Regularization adds a penalty to the cost function to discourage overly complex models and reduce overfitting. Lasso uses L1 regularization and Ridge uses L2 regularization.
10	What is Logistic Regression used for?	Logistic Regression is mainly used for classification. It uses the sigmoid function to convert a linear combination of inputs into a probability between 0 and 1.
11	What is the difference between Gini Index and Entropy?	Both measure impurity in a decision tree. Gini Index measures the probability of incorrect classification, while Entropy measures the uncertainty or disorder in the data.
12	What is the difference between Bagging and Boosting?	Bagging trains multiple models independently and combines their results, while Boosting trains models sequentially, with later models focusing more on previous errors. Random Forest is a Bagging method and XGBoost is a Boosting method.

Sr. No.	Question	Answer
13	What is Bayes' Theorem?	Bayes' theorem calculates the posterior probability of an event using prior probability and likelihood: (\displaystyle P(X
14	What is Naïve Bayes?	Naïve Bayes is a probabilistic classification algorithm based on Bayes' theorem. It assumes that features are conditionally independent given the class.
15	Why is Naïve Bayes called "Naïve"?	It is called naïve because it makes the simplifying assumption that the features are conditionally independent of each other given the class.
16	What is a Bayesian Network?	A Bayesian Network is a probabilistic graphical model represented using a Directed Acyclic Graph (DAG), where nodes represent variables and directed edges represent probabilistic dependencies.
17	What is inference in a Bayesian Network?	Inference is the process of calculating the probability of an unknown or query variable using observed evidence and the relationships represented in the network.
18	What is the difference between predictive and diagnostic inference?	Predictive inference goes from cause to effect, such as (P(Fever
19	What is Support Vector Machine?	SVM is a supervised learning algorithm that finds an optimal decision boundary that separates classes while maximizing the margin between them.
20	What are Support Vectors?	Support vectors are the training data points closest to the decision boundary. They play a major role in determining the position of the optimal hyperplane.
21	What is a kernel in SVM?	A kernel is a function that allows SVM to work with nonlinear relationships by effectively mapping data into a higher-dimensional feature space.
22	What are the main kernels in your syllabus?	The main kernels are Linear, Polynomial and Radial Basis Function (RBF) kernels.
23	What is Association Rule Mining?	Association Rule Mining is an unsupervised technique used to discover relationships and frequently occurring patterns among items in a dataset.

Sr. No.	Question	Answer
24	What are Support, Confidence and Lift?	Support measures how frequently an itemset occurs, Confidence measures how often YY occurs when XX occurs, and Lift measures the strength of the association compared with independence.
25	What is Clustering?	Clustering is an unsupervised learning technique that groups similar data points into clusters without predefined class labels.
26	What is the basic idea of K-Means?	K-Means divides data into KK clusters by assigning each point to the nearest centroid and repeatedly updating the centroids until the clusters stabilize.
27	What is the difference between K-Means and K-Medoids?	K-Means uses the mean of the points as the cluster center, whereas K-Medoids uses an actual data point as the representative center or medoid.
28	What is the difference between Agglomerative and Divisive clustering?	Agglomerative clustering is a bottom-up approach that starts with individual points and merges them. Divisive clustering is a top-down approach that starts with one cluster and repeatedly splits it.
29	What is Dimensionality Reduction?	Dimensionality Reduction reduces the number of features or dimensions while attempting to retain the important information in the original data.
30	What is PCA?	Principal Component Analysis (PCA) is a dimensionality reduction technique that transforms the original features into principal components arranged according to the amount of variance they explain.
